kathara lab

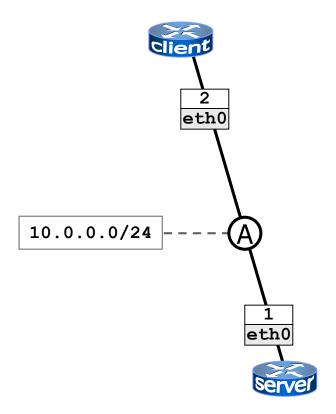

web server and browser

Version	1.0
Author(s)	Giuseppe Di Battista, Maurizio Patrignani, Massimo Rimondini
E-mail	contact@kathara.org
Web	http://www.kathara.org/
Description	A lab showing the operation of a web server accessed by a browser client – kathara simplified version of the corresponding netkit lab vers. 1.2

copyright notice

- All the pages/slides in this presentation, including but not limited to, images, photos, animations, videos, sounds, music, and text (hereby referred to as "material") are protected by copyright.
- This material, with the exception of some multimedia elements licensed by other organizations, is property of the authors and/or organizations appearing in the first slide.
- This material, or its parts, can be reproduced and used for didactical purposes within universities and schools, provided that this happens for non-profit purposes.
- Information contained in this material cannot be used within network design projects or other products of any kind.
- Any other use is prohibited, unless explicitly authorized by the authors on the basis of an explicit agreement.
- The authors assume no responsibility about this material and provide this material "as is", with no implicit or explicit warranty about the correctness and completeness of its contents, which may be subject to changes.
- This copyright notice must always be redistributed together with the material, or its portions.

lab topology

lab description

- server
 - runs apache2 (with a default configuration)
- client
 - the user can launch a text-based web browser (links) to check the server operation

server

the user can check that apache2 is up and running by using the following command:

```
Server:~# /etc/init.d/apache2 status
Apache is running (pid 485)..
server:~# ■
```

we have put a test html page, located in /var/www/html/index.html

```
<html><body><h1>Hello!</h1></body></html>
```

client

the user is supposed to start the web browser links on the client

- an empty screen is presented to the user...
- to access the menu bar, press F10
- using the cursor keys, select "Go to URL" and press Enter

client

enter the following URL:

http://10.0.0.1/

you should get a screen saying "Hello!"

last update: Oct 2018

server (again)

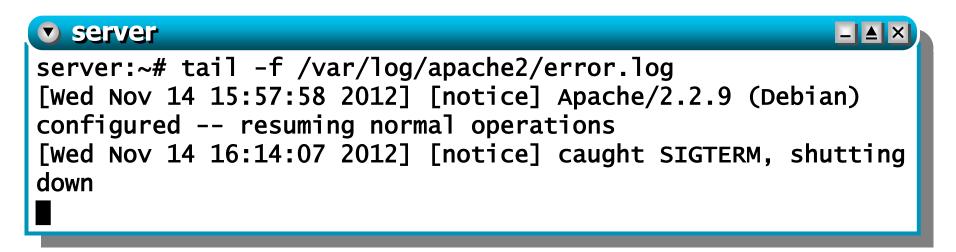

to monitor accesses to the web server you can use the following command (on the server):

```
▼ Server:~# tail -f /var/log/apache2/access.log
10.0.0.2 - - [19/oct/2011:08:04:08 +0000] "GET / HTTP/1.1"
200 56 "-" "Links (2.2; Linux 2.6.26.5-kathara-K2.8 i686;
80x39)"
■
```

last update: Oct 2018

server (again)

to monitor errors on the web server you can use the following command (on the server):

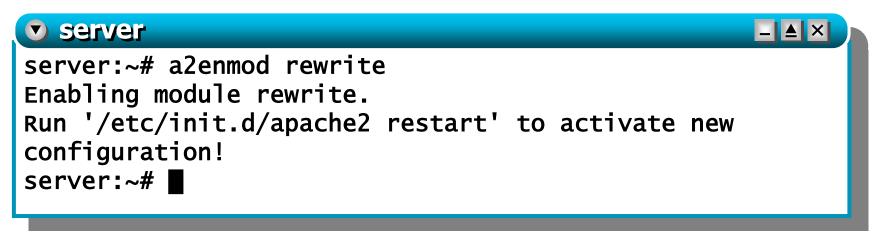

tip: very useful when debugging configurations

apache modules

- most of apache's functionalities are built-in
 - retrieve the list using apache2 -1
- others can be added by enabling modules
 - to enable a module:

apache must be (re)started afterwards

apache modules

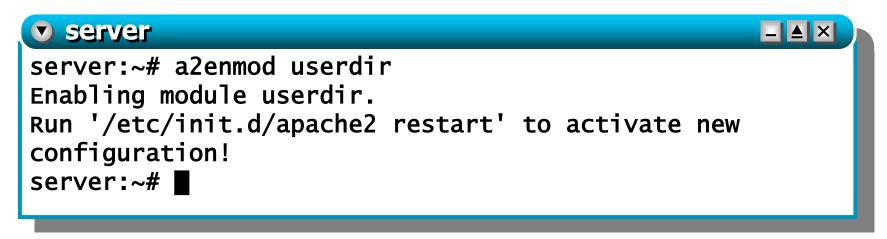

- available modules are located in /etc/apache2/mods-available
- enabled modules are located in /etc/apache2/mods-enabled
- a2enmod puts a symbolic link from the relevant file(s) in /etc/apache2/mods-available to /etc/apache2/mods-enabled
- a2dismod removes these symbolic links

some useful apache modules

userdir	enables per-user web sites
rewrite	implements URL rewriting
proxy	implements a proxy/gateway
cgi/cgid	supports execution of CGI scripts

per-user web sites

enable module userdir

- by default, userdir looks for per-user sites in /home/username/public_html
 - check file /etc/apache2/mods-enabled/userdir.conf

exercise: per-user web sites

hands-on:

- create directory /home/guest/public_html ON
 server
- put a simple index.html inside that directory
- check operation of the user web site by accessing http://lo.0.0.1/~guest/ from client

per-directory configuration

- apache allows configuration changes on a per-directory basis
- creating a special file /some/path/.htaccess with apache configuration statements applies those statements to all files and subdirectories inside /some/path
 - .htaccess files can be nested in a directory tree
 - nested files override their parents

per-directory configuration

- sample configuration statements:
 - restrict access from specific hosts
 Deny from example.org test.com 10.0.0 192.168.0.0/24
 - perform URL rewriting
 - (transparent) redirect to other sites
 - restrict access to a specific subdirectory
 - enable client-side authentication
 - change name of file containing the default page DirectoryIndex pippo.html
 - enable/disable directory indexingOptions -Indexes

exercise: per-directory configuration

- when a resource name is not specified in the URL, apache serves index.html from the requested path
- hands-on:
 - Edit file /home/guest/public_html/.htaccess and add the following directive: DirectoryIndex custom file.html
 - rename previously created file /home/guest/index.html tO custom_file.html
 - try accessing http://10.0.0.1/~guest/ from client
 - rename custom_file.html back to index.html and try accessing the page again
